

Batch FTP Print

Contributed by
Monday, 26 June 2006

Batch print Helper includes a built-in FTP client. The Built-in FTP client allows PrintHelper users automatically print files located on a remote FTP server.

How FTP Client works:

- PrintHelper logs into a remote FTP server with a username and password. Additional parameters such as path and file types to be printed can be specified.
- FTP client can download from a remote FTP server and print files one time or it can be scheduled to repeat this procedure.
- For example PrintHelper can be scheduled to login into an FTP server every 60 minutes, collect file information and automatically print new files.
- User can specify to print all or new files only.
